

The logo consists of the letters 'CYE' in a bold, dark blue font. The 'C' is stylized with a teal-colored arc passing through it. To the right of the logo is a network diagram featuring a semi-circular arrangement of teal dots on the left, with thin grey lines connecting them to a series of dots on the right. Some of these dots are further connected to a small cluster of dots below them.

Why Your Cybersecurity Program is a Horse's Behind

CYE

What Can We Learn?

- It's easy to perpetuate things year after year
- Continuing to follow the ass keeps things simple
 - Not better, but easier
- Removes need to think and experiment
- Advances limited by ruts
- Attempts to deviate can cause damage and setbacks without the right infrastructure

Typical Cybersecurity Budget Game

- What was last year's budget?
- Is there more money?
- Are there any countermeasures you really want?
- Validate against percent of IT budget

The Big Problem

CISOs get the budgets they Deserve,
not the budgets they Need. They need
to learn to Deserve what they Need

CYE

The logo features the letters 'CYE' in a bold, dark blue font. The 'C' is stylized with a teal-colored arc passing through it. To the right of the logo is a network diagram consisting of numerous teal dots connected by thin grey lines, forming a complex web. Below this, a series of teal dots are arranged in a curved path, leading towards the network. The background is a light blue gradient with a faint, larger-scale network pattern.

Does This Make Any Sense?

Are you protecting IT or organizational value?

Other Disciplines Collect Hard Numbers

- Operations
- Accounting
- Safety Science
- Supply Chain

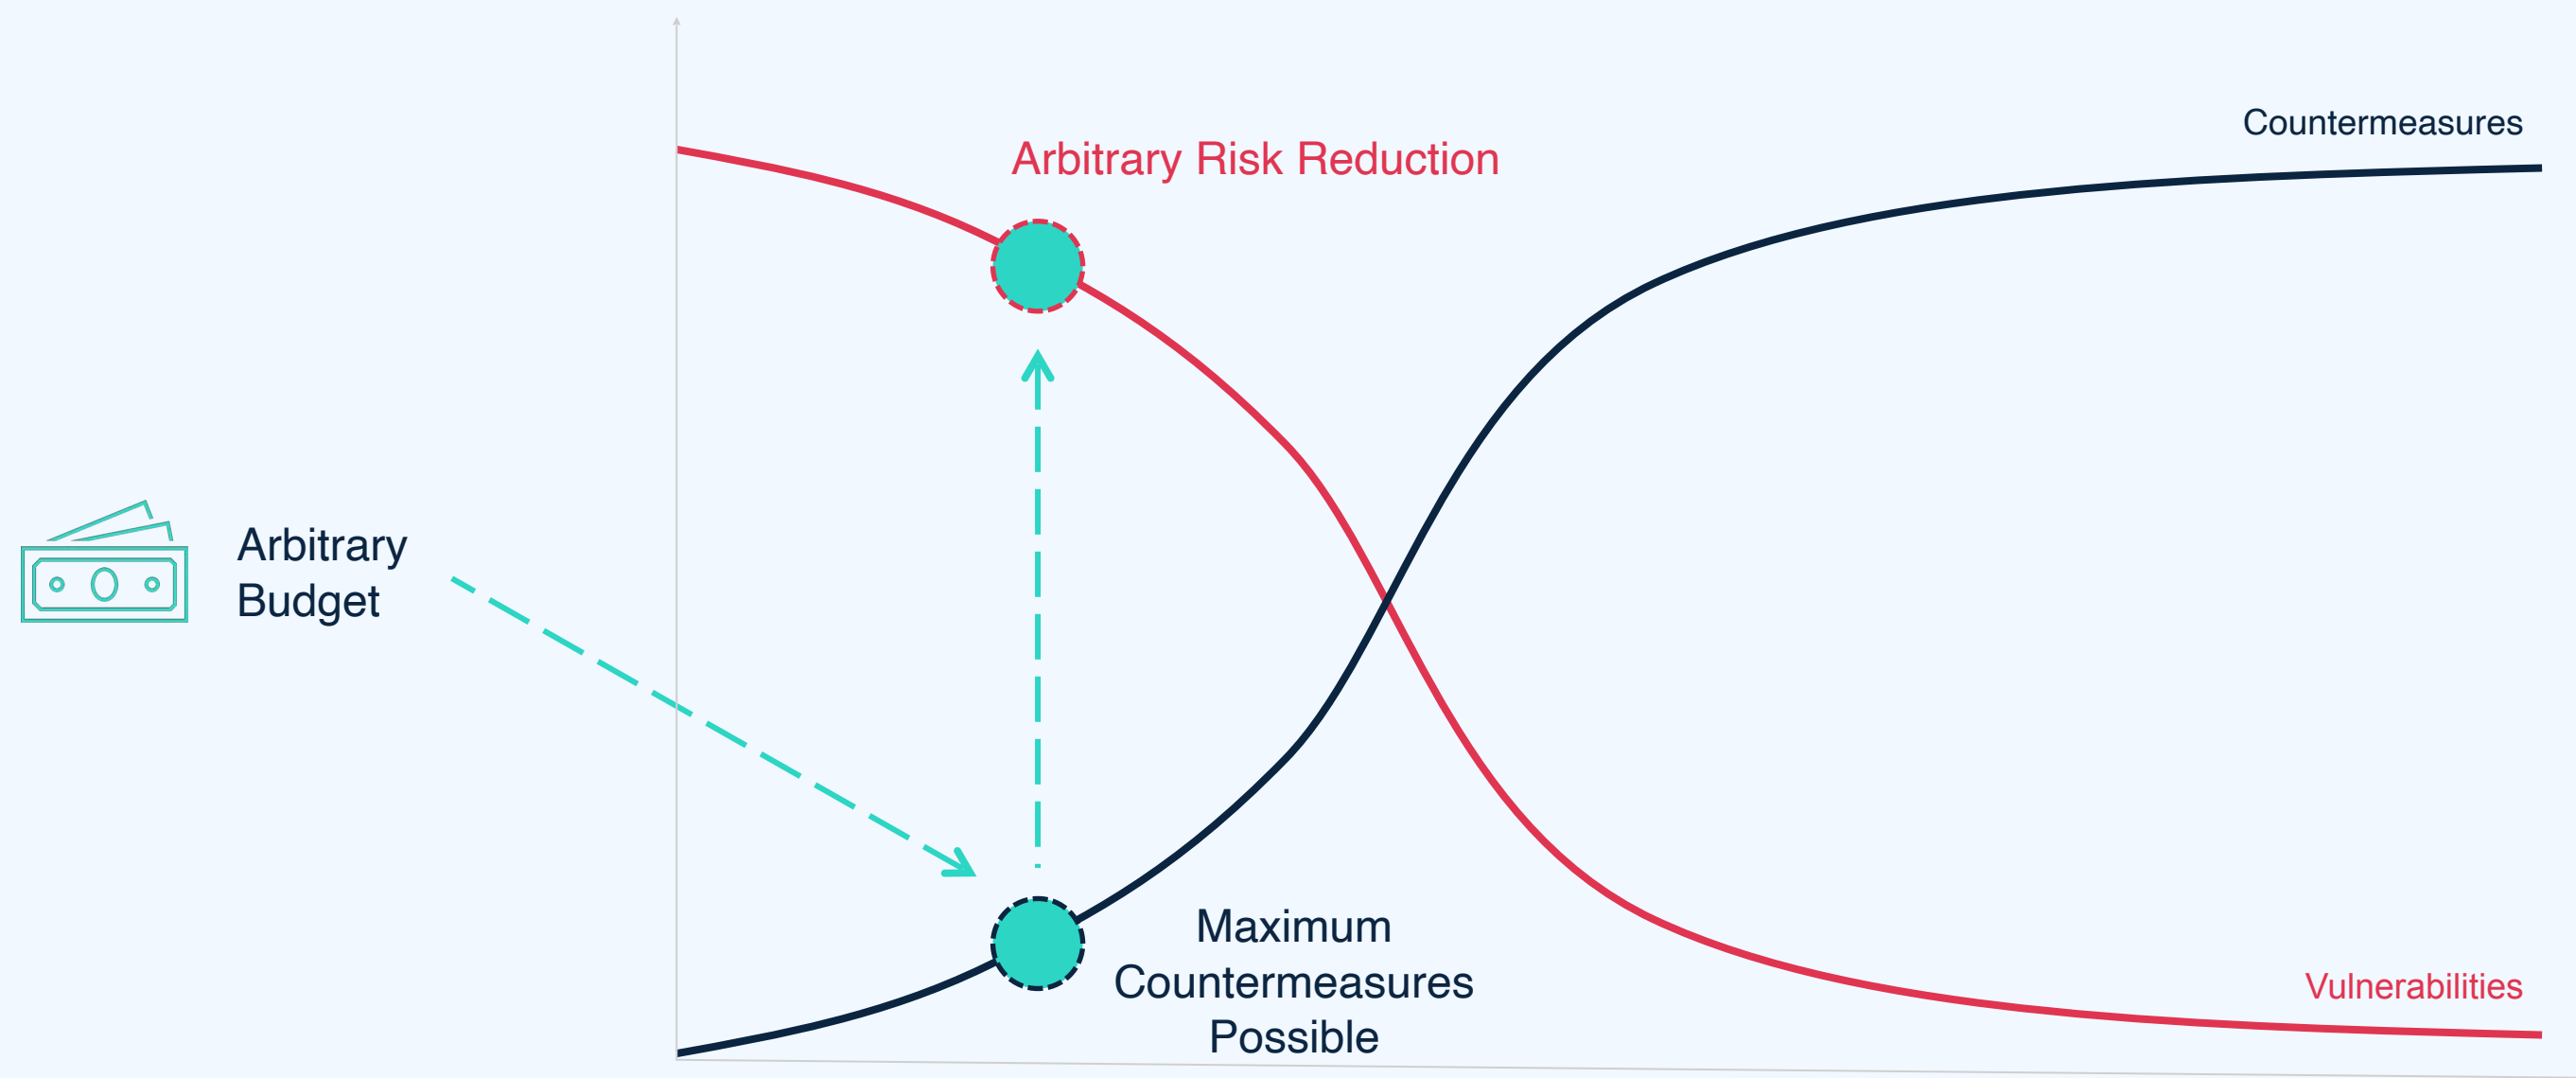

Crude Risk Equation

$$\textit{Risk} = \frac{\textit{Value} \times (\textit{Threat} \times \textit{Vulnerability})}{\textit{Countermeasure}}$$

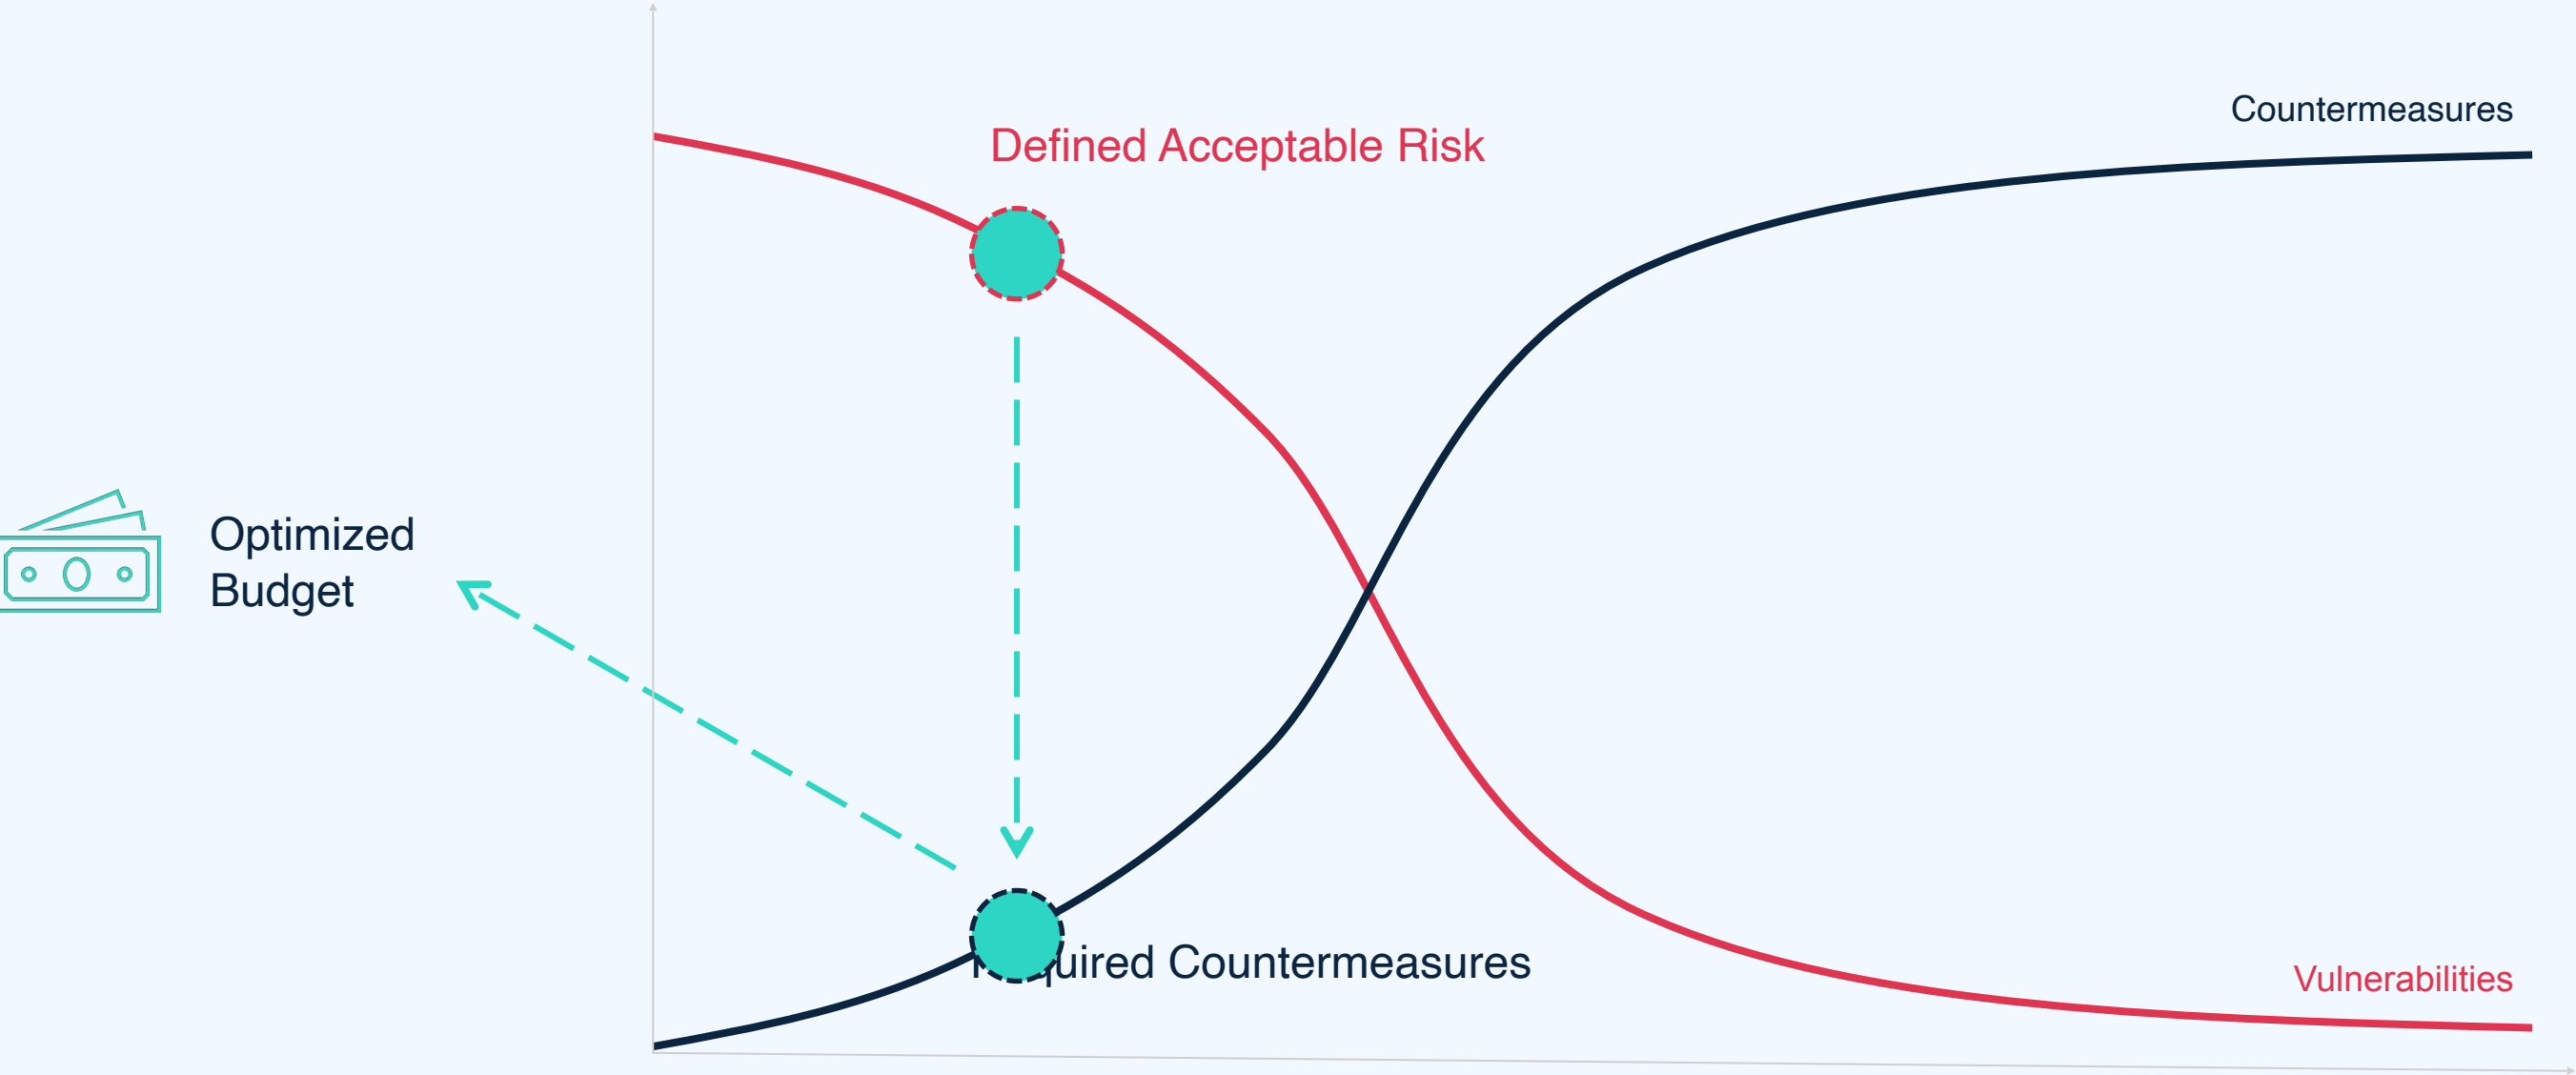

Optimized Risk

Budget-Driven Implementation of Countermeasures

Return on Investment-Driven Budget

Optimization of the Cyber Risk Investment

Determine Potential Loss

- Hard and soft
- Financial theft
- Cost of outage
 - Availability loss
 - Income losses
 - Customer acquisition costs
- Data breach costs
- Investigation
- Recovery
- Fines*
- Reputation costs
- Insurance deductible
- Insurance increases
- Will insurance pay at all?

Variable Factors

- Geographies
- Regulatory environments
- Legal environments
- Company size
- Industries
- Incident history
- Viability of cybersecurity and risk program
- Highly complicated if you're in multiple areas

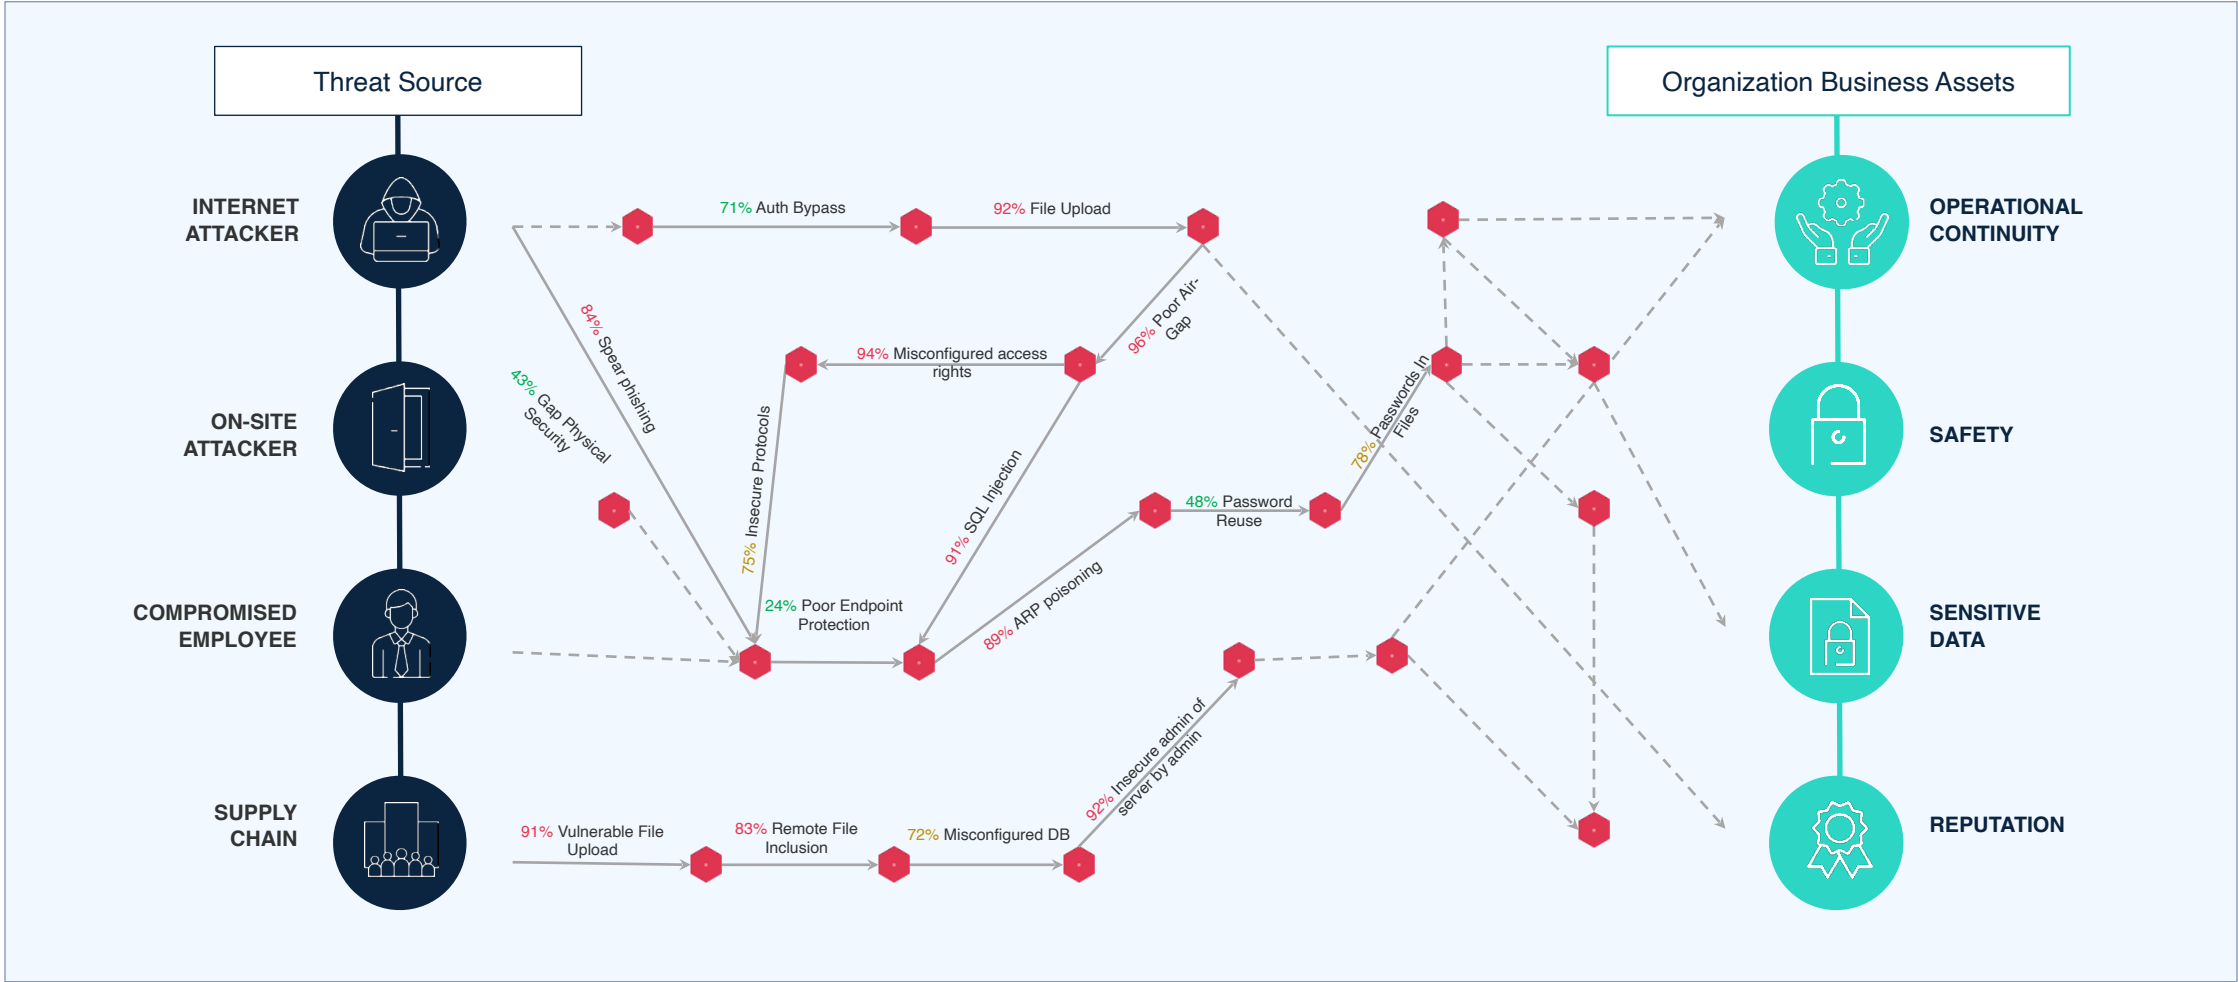

Obtaining Value

- Admittedly not easy
- CFO
- Industry incidents
- Insurance data
- Third party tools

Probability

- Likelihood a threat will exploit the vulnerability
- Skill level of threat
- Availability of exploit
- Data on dark web
- Threat intelligence
- Difficulty of exploitation
- Motivation
- Attack path dependencies
- Vulnerability Criticality not a determining factor

Calculate the likelihood of incident scenarios

Determine Vulnerability Cost

- Vulnerability Cost(N) = Prob(N) x $\sum_{R0}^{RN} Risk$

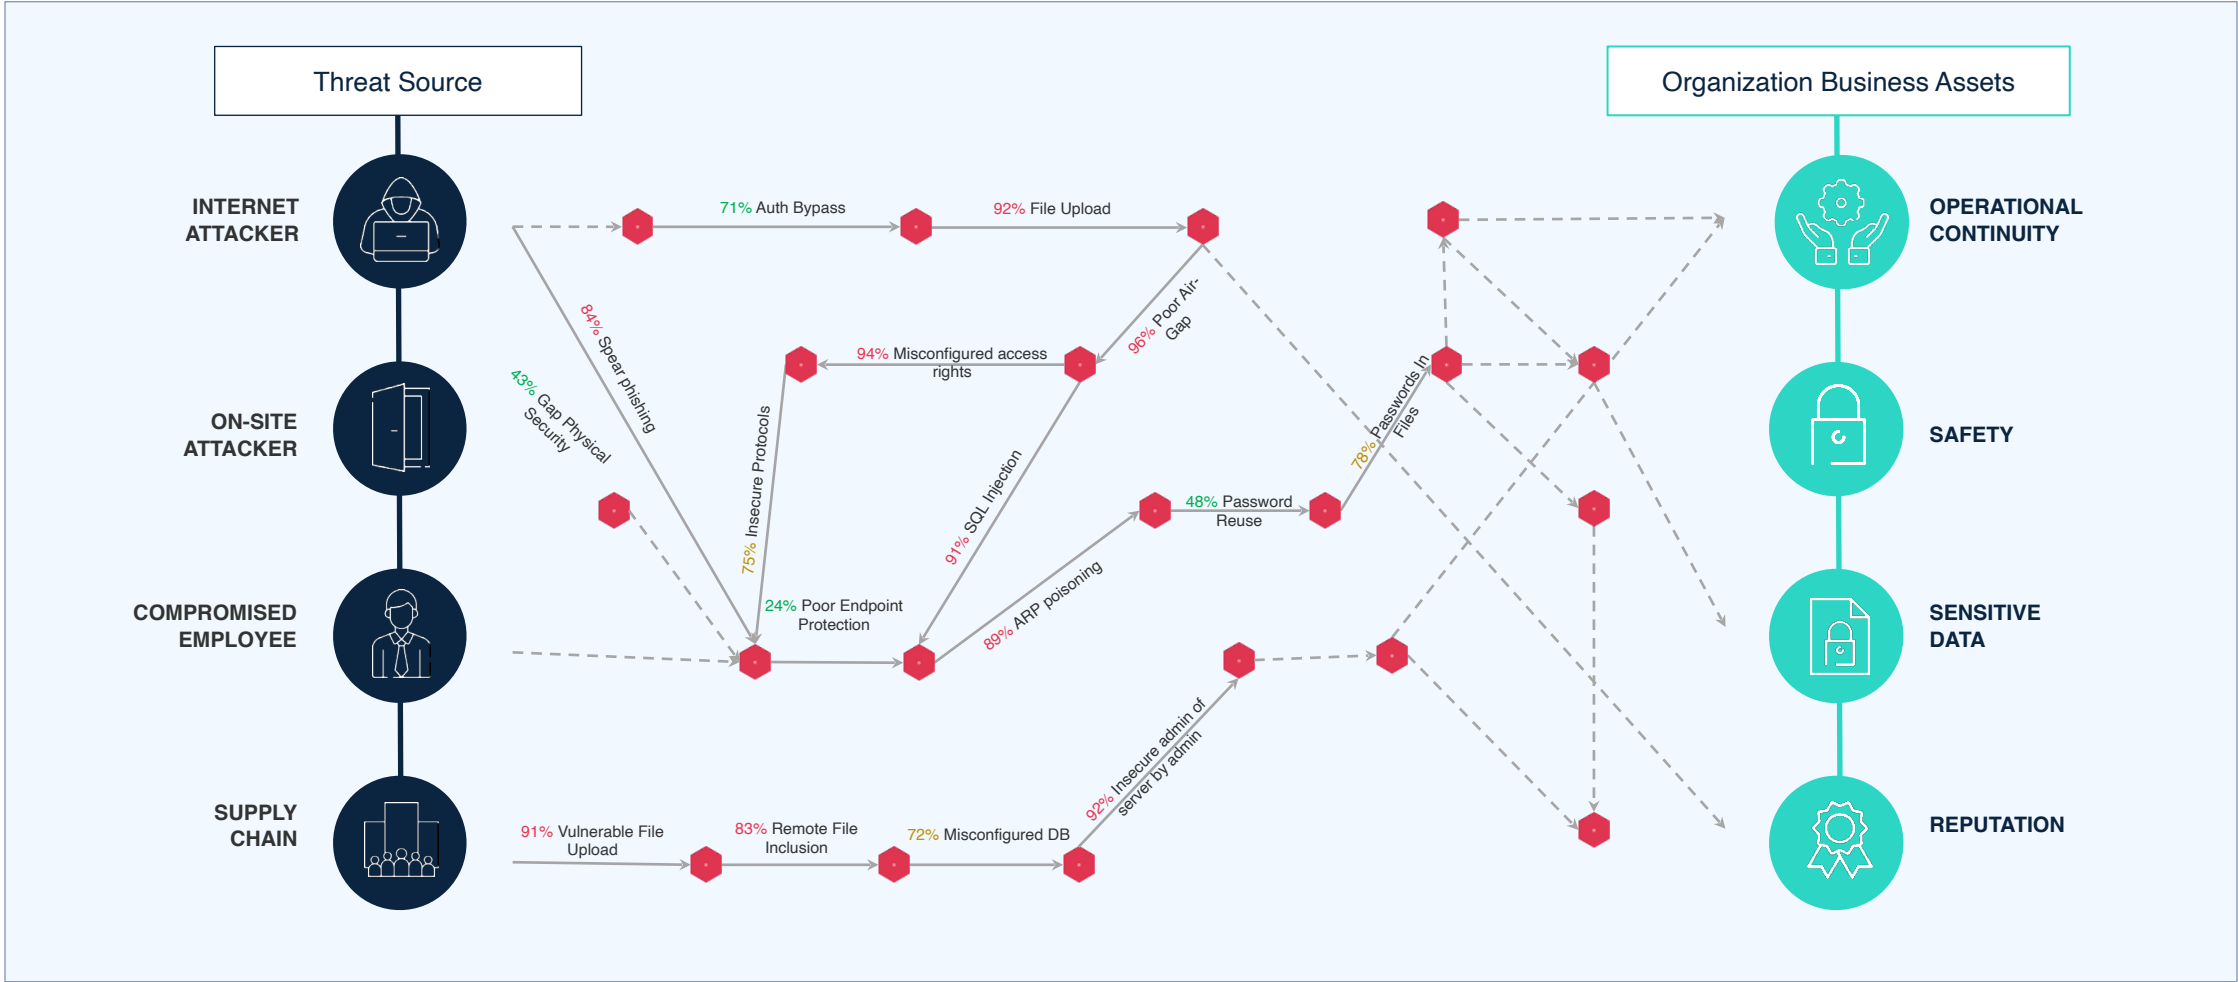

Is It Worth Mitigating a Vulnerability?

- Does the countermeasure cost more than a loss?
- Determine cost including all factors
 - Price, people, maintenance, geography,
- Consider one countermeasures might mitigate multiple vulnerabilities

Prioritize

- Attack path choke points
- High return countermeasures
- Multiple mitigation countermeasures
- Quick wins
- Low effort

Choke Points

Put it Together

- Deserve What You Need!
- "With a cost of \$XXX,XXX, I will mitigate \$YY, YYY, YYY."
- Highlight regulatory losses
- Highlight recent lawsuits
- Have management acknowledge costs of rejection of request
- Document it?
 - Nice if you can.

Deserve What You Need

- Every countermeasure has a calculated ROI
- Present your cybersecurity program as having a very specific risk reduction
- Counter any budget cuts with specific increase in monetary risk
- Define the cybersecurity program in the same way all other business processes are
